-01-222019-01-22 Therapy Field of the Invention The present invention relates to a display apparatus for displaying an image. 2. Description of the Related Art A liquid crystal display (LCD) has been widely used as a display apparatus for displaying an image. In particular, a thin type and light weight display apparatus which has low power consumption and which can be manufactured at a low cost has been widely used. In a flat-panel display apparatus which uses a light emitting element such as an organic light emitting diode (OLED), an inorganic light emitting diode, or a phosphor, image data is written by applying a voltage to the light emitting element in a time-division manner. The image data is written by accumulating a predetermined writing period. Further, a light emission state of the light emitting element is caused to correspond to a luminance level of the image data, and the light emitting element emits light having the luminance level which corresponds to the image data. It is necessary to control a voltage applied to the light emitting element for each pixel by dividing a voltage (a plurality of voltages) applied to the light emitting element to respective pixels. For example, Japanese Unexamined Patent Application Publication No. 2006-138446 discloses a display apparatus in which gate lines and data lines are arranged so as to intersect each other and in which a plurality of switching elements, a scanning driver, and a data driver are arranged in each intersection of the gate and data lines. The scanning driver sequentially selects the gate lines in synchronism with a start signal. The data driver supplies a voltage to the data lines on the basis of image data to be displayed. Further, the switching elements are driven on the basis of a scanning signal which is generated by the scanning driver. This structure makes it possible to select the switching element, control a current which is to flow to a light emitting element through the selected switching element, and control a light emission luminance of the light emitting element.Q: Is it possible to use case sensitive/case insensitive query inside of css/xpath I have a question about the case sensitive/case insensitive selector using xpath 82157476af
